

## 50% higher card density in a 1U frame

With a 33% space saving, dual psu's and SNMP as standard, the new HD1U frame from Microvideo gives the highest density of any 1U rack on the market.

Let's put this into perspective; compared to the industry standard 3U racks, giving between 10 and 15 cards per frame, the HD1U offers 18 cards within the same footprint, and compared to the normal 4 card 1U frames it's a 50% increase in the number of cards, a cost saving on frames, reduced network infrastructure, less maintenance, less cabling, good for you, good for your budget, good for the environment....In fact, let's face it, it's good for everyone.

With the HD1U you get SNMP as standard, monitoring state of health of power supplies and fans. Even if you only need 1 card today, the frame comes complete with fully populated backplane allowing new cards and rear carriers to be fitted as and when you need them, saving time and money now and keeping the flexibility for when you need it.

If you want more information on the HD1U frame or any of Microvideo's data management, switching, branding or signal processing modules just click here:

Remember with Microvideo "the answers YES, now what's the question"
